Figures

Figure 1: UI design: from arbitrary to hard numbers.	3
---	---

1 Conifer Digital

Conifer Digital is a Finnish indie game company founded in 2023. It consists of three members: Pertti Hakala, Jyri Markkanen and Joonas Huovilainen. Pertti is responsible for game design, programming, marketing, public communications and company management. Jyri is responsible for art design, production, writing, game design and marketing, whereas Joonas is responsible for art design, UI design, game design, sound design, marketing and project management. The core three has all the necessary roles and responsibilities (and skills) for running the company very well.

The company just released their first product on April 30th, 2025: Versebound. The game Versebound is an action roguelike set in the world of Kalevala.

2 My job descriptions

2.1 Length of the training

The practical training started on January 7th and ended on April 30th. The total length of the training was 463 hours, totaling 17 credits. The time sheet of exact hours can be found from Appendix 1.

2.2 My duties

2.2.1 UI Design

One of the first assignments for the training was to re-design the UI for weapon and passive level ups. The gathered feedback from playtesting showed that players, especially in these types of games, want actual, hard data what the numerical values are when you level up, precisely how much stronger you get. This included finding the correct data from Excel, comparing it to the Unity prefabs and scriptable objects do the match (if not then ask and fix), re-writing the text in the UI and asking feedback from other team members. Many designs took multiple iterations where spacing, wording, font size and to use dot or not, were in question. Figure 1 shows progression of changing from arbitrary “damage up” to factual numbers.

Figure 1: UI design: from arbitrary to hard numbers.

Later in the project I fixed smaller things such as replacing comma with a dot for more cleaner look for example changing the stat value from 1,5 to 1.5, added my own programmed mechanics in the pause menu such as drop-down menu for fps cap with different options and overall cleaning or changing texts in different UIs.

2.2.2 Audio (Sound Effects)

Sound effects were one of the larger parts of my practical training. During most weeks I had one or more sound effects I would work on. I would discuss with Joonas beforehand and ask what sounds I should do, and he would give me descriptions of how they would sound and what sounds it could include. Thereon out I perused sound libraries such as Splice and Freesound, listened to them and added into Reaper project and started messing around with them. Layering, adding echo, widening or narrowing soundscape and increasing higher tones were the most common practices I used to make the sound better. One sound effect usually took around 10-20 iterations and 1.5 to 2 work-days to finish. Most of the sound effects were one-shots: such as a weapon or an artifact activation, clicking on unlocking sound in bestiary but I also created dynamic hub environment sound system: different looping sounds in the hub and when player gets closer their sound increases and vice versa. The system had 7 different looping sounds: beach, firepit, forge, beer barrel, mosquito swamp, ghostly garden and northern breeze from a statue. The environment also had animation-based sounds for a crow whenever it screeches and hammer hitting on anvil. Also, the ghost in the garden had a system where it spoke a poem from Kalevala with small delays between sections.

Since licensing is something that had to be taken note of, I made sure that sounds elsewhere were CCO licensed, and in the case of sounds from Splice, I created a license list of the sounds I used and handed it over to Joonas. This means that there is no copyright infringements of the sounds used in-game.

2.2.3 Programming

Programming was a very minor part of the practical training. Mostly consisting of small bug fixes but I also added code into existing scripts such as steam achievements or pause menu expansion. Also, I programmed the dynamic environmental system. Another bigger task was to rework one of the weapons: Northland Bow. Previously it shot arrows straight forward from the center of the player. This made the weapon pretty bad and difficult to use, especially for beginners. What I ended up doing was creating an adjustable cone from the center of the player (ending up 12 degrees wide), allowing now to shoot enemies that are a bit off from the center, making it still similar as it was, shoot arrows to your movement direction, but making it much better and easier to use.

All in all, a lot of the back-end tasks I could do in the editor by just tweaking the values of prefabs and scriptable objects. I also made small quality of life changes such as improving hitboxes.

2.2.4 QA & Balance

The balance was a major part of my training, spending most of the time with it or related to it. Balance included testing and playing the game, but also tweaking of basically every numerical value in the game such as:

- stats of all the weapons and passives multiple times by trying to make all of them viable but different
- stats of the playable characters and their move skills
- all of the enemies including basic, secret bosses and other bosses
- level progression by modifying different values such as enemy wave amounts, spawning boss HP multipliers, experience needed for the next levels etc.
- stats of the dropping items such as healing berry, puolukka
- and more

Not only testing individual levels or weapons or characters, but I also created fresh builds and tested for any bugs and if any UI was messed up. Also, for the game feel, starting a new game from scratch and test that all the progression works as intended.

For any type of testing I used different Excel sheets, reference material such as “anchor weapon” or previous run’s stats, trying to gather as much data as possible and compare. For instance, before starting the weapon balance, I wrote down the “feel” of the weapon how it should be and how it should feel like when the player is using it. One example of this was weapon called Mother’s Tears, I wrote down: “THE support weapon, slows down enemies, does not deal a lot of damage, helps with certain bosses and is viable with some builds only, very easy to use and has a lot of CC”.

2.2.5 Marketing

I worked with Joonas in the marketing of the game. He had nifty software that gathered YouTubers based on certain keywords such as have they played “insert game name here” games and made video about it, how many subscribers they have etc. That data was compiled into Excel sheet that I used for my work in marketing. With Joonas, we created e-mail templates what we would send said YouTubers in hopes of them playtesting our game. My job was to send those e-mails, customize them by adding their name and games they have played but also a steam key, allowing them to test the game whenever. I also acquired e-mails from YouTube channels that were listed in Excel for this cause. Also, one of my assignments was to create a reddit post template that Joonas would edit and publish. I scavenged through old photos of the alpha version of the game, played the game and took a screen capture with similar settings and with current art style, gave suggestions for reddit channels where to post and gave suggestions for the title of the post. ([link](#)).

2.3 Orientation to work

Orientation to work started a day prior to the practice, on 6th of November. Me and Pertti were in Discord call going through everything needed for the training: about the company, my schedule, my absences during the training, contract, timetables of the game (such as Steam Next fest), roles of the team members of the company, tools they use, what my practical training consists of, the

means of communication and first tasks of the training. All of it can be found in Finnish from Appendix 2.

As for tools, we also went through how to use them, for example GitHub: which branches to merge, creating my own branch, and GitHub basics. Other clarification included Unity version we would be using, Excel sheets we would be working on (and new ones to be created), how Miro board works and more.

2.4 Work Environment

I worked from home on my own PC, having Discord calls with team members when necessary. My schedule was around 10 am to 4 pm, whereas other team members would work whenever they had time (afternoons or late evenings, depending on school and work). This worked surprisingly well since I could wait for their response and get back to it the next day. Although usually they were able to answer during the day, which helped a lot, especially in cases where small but numerous tweaks were necessary, such as UI design for level ups.

2.5 Needed skills and knowledge for the work

Since Pertti is one of my best and longest-standing friends he knew who I was and what my skills were, most notably my skill to quickly adapt to new situations and learn new skills. We also discussed the game for two years before practice and I have play-tested it, knowing the game quite well. The other team members I didn't know that well, so having face-to-face meetings in the first weeks was very valuable. Studying game development and creating card/board games before was a good plus, especially TiCorporate where I gained knowledge a lot for game development such as Steam publishing and Steamworks.

2.6 How could the work be improved

Since I was their first long-standing and full working trainee, starting off was a bit hectic and not all the tools were used to their fullest, but they evolved as the training went on. Meaning for example in the first days of the practice, I sent pictures and questions via WhatsApp to Pertti about the UI design, which we quickly realized was not convenient at the slightest. First, the other members did

not see them or could react to them, they got convoluted to other texts, and we already had communication channel: Discord to use for that. We quickly adapted to Discord by creating a new channel for me called “intern-text-aapo” where I could send my suggestions. Other adaptations were made and overall, I think the workflow, especially towards the end, was very good and efficient.

One thing that could’ve been improved was the amount of Excel sheets and manual work that needed to be done, for example when balancing weapons. This was discussed and unfortunately there was no time to implement it on this project, but the team is well aware and has taken notes for the next project. This means for example having data updating straight from Excel sheet to Unity scriptable objects et cetera.

3 Learning in the workplace & personal challenges

My personal challenges are being insecure about my own abilities and lacking confidence. In this project it was mainly a small annoyance (never heard anyone complain though which was fantastic) to other team members, and it was quickly washed off by the praise I got or suggestions on how to do something better or how to improve my work.

I learned more about Unity and programming: using Rich Text in text fields, using scriptable objects, learning how to change “,” to “.” in UI (very important), read other people’s code, suggest a fix for a bug, removing excess console texts and more. I also learned how to use Miro, which I never tried before, create better Excel sheets with custom formulas for automation, learned about Discord threads and how to utilize them (very useful), how to edit audio better such as widening the space so they sound that they are coming from further away or narrowing the space to give the sound more closer feel. Also, I gained overall more, much appreciated, company-based experience, working on a professional game project with a team.

4 How BIT prepared me for the training

BIT helped me with knowledge gained for programming, using Unity, game design, audio design and editing, team working and social skills. Most notoriously the TiCorporate course, having such a

wide range of tasks for an individual for a game project. In TiCorporate I worked on publishing, coding and production, all of the skills were very useful.

5 Quality and quantity of guidance from the degree program in relation to the work

As previously mentioned, the basic courses in design, programming, game engine, audio etc. were useful for hand-on skills for specific tasks but TiCorporate gave real-life experience, which helped a lot to be a trainee in a game company. During the practical training I did not ask for, nor needed, help from the degree program, since the team were able to help me perfectly.

6 Guidance and support from the workplace for performing work tasks

Guidance and support from the workplace were substantial for me in the training. I was able to do a lot of the work independently or find the answer myself, but in special cases where it was precisely for the project (such as does this *look* or *sound* good for the game) I got help from the team immediately. Also, I want to point out the fact that the team members were very positive and supporting throughout the project, also honest and realistic. For instance when the time was running out and the release date was closing, I was working on a sound effect but couldn't make it just right, being little off, the other team members said that it was good enough and not bad at all, allowing me to jump on to next task so we could finish the project in time.

7 Company and work tasks vs suitability for student at BIT

I think this training was perfect, at least for me. The sheer number of different duties I could do was awesome. Also as previously mentioned the support was great and the project was, at least for me, interesting and fun. Duties such as testing were fun since the game itself is fun to play. I also think that for a student this was good practice to see what it is like to work in an indie company, where you can get your hands dirty on different levels, also learning about social aspects of working with a company and learning the importance of communication.

8 Practical training seminar

I had my practical training seminar in Game Testing course lecture for second year students. This was exceptionally helpful by granting us free game testers, also allowing me to improve my game testing skills by designing the questionnaire and the game test itself. I held the presentation by showing what I had done so far (the seminar was held around mid-point of my training), what the company and game was about, what I was happy or unhappy about in the training and finally the listening student's task for the next few weeks: play Versebound and give feedback. Personally, I was very nervous and not sure of the quality of the presentation, but I managed to push through and go through the essentials.

9 How would I develop the practical training process

I'm not sure. Some people might want to have more meetings with the teacher during the training, but I felt that it wasn't necessary. Finding a practical training spot is very difficult and requires a lot of effort and self-initiative, I hope that the students get a lot of help with that. Another fact is having a portfolio, we only have been suggested to do it, but having an actual course during third year spring would be great. Having an actual course for it would force students to make a portfolio but also help in making it look and sound good at every level would be so helpful. For example, I lack motivation to do it even though I know it is very important and would help me a lot.

10 Quality of practical training in relation to my studies and employment

I think it would be a solid 5. I get to work on a lot of different aspects of game development, with very good support and guidance from the team, whilst them being very friendly and open-minded too. However, in future career options, especially in bigger companies, I might not be able to do so many different things and so freely, but we'll see!

Appendix 2. 250105 AAPO starttipalis / perts, aapo

Conifer Digital Oy

- 3 hengen indiepelifirma (perts, jyri, joonas)
 - Kaikilla työskentely sivutoimista
- Perustettu vuoden 2023 marraskuussa
- Tuottaa ensimmäistä kaupallista peliään, Verseboundia
- Käytössä olevat resurssit: aika, henkilökohtaiset sijoitukset ja pienet työskentelyapurahat

1. Aapon aikataulut

- 7.1.-30.4.25
- Noin 30h / viikko
- Poissaolot: 22.1., 27.-31.1.

2. Soppari minttiin: allekirjoitetaan 11.1. Helsingissä, kumpikin saa 1kpl

3. VB aikataulut

- Steam next fest demo: 24.2.-3.3.25
- Release: 30.4.25

4. Roolit firmassa

- Perts
 - Punaiset langat (paitsi markkinointi)

- Koodi
- Logiikan ja mekaniikkojen design
- Discordin ylläpito
- Numerot, balance
- Jyri
 - Lore, tekstisisällöt
 - In-game grafiikat
- Joonas
 - Sound design (ei musiikkia)
 - Markkinointi
 - UI-graffat
- Bema eli Benjamin (työskentelee apurahalla)
 - Yksittäisiä artworkeja, kuten päivitetty steam capsule. Myös in-game tsydems, esim. Hahmojen avatarkuvat
- Ali (harkkari)
 - koodi
- Minttu (harkkari)
 - Bestiarykuvat
- Elyvilon (commission work)

- musiikki

5. Appit yhteydet jne

- Discord
 - Palaverit
 - Dev-text -kanavalle voi jakaa työn edistymistä
- Whatsapp
 - Conifer Digital: Kaikki <- vapaa kommunikaatiokanava
 - Yksityisviestejä vaa laittaa kenelle vaan (perts, jyri, joonas)
- Miro
 - Boardi developmenttiin liittyvistä asioista, lähinnä pertsan käytössä
 - Tänne tulee aapon työtehtäviä, ainakin pääpiirteittäin
- Github
 - Github desktop käytössä
 - Repo: pertsaboi/KalevalaSurvivors
 - Workflow:
 - Session alussa Fetch origin -> mergee branchit: perts-24, jyri_tesbed, jayn-playground
 - Jos vaikuttaa siltä, että saattaa tulla muutoksia esim. Skeneihin samaan aikaan kuin muilla, niin kannattaa tarkistaa onko joku työskentelemässä jo (esim whatsapp kaikki-kanavalla)
 - Commitit oman logiikan mukaan

- Session lopuksi push
- Ei kosketa muiden brancheihin muuten kuin mergessä
- Excel
 - Game Data: speksejä kaikesta datasta pelissä
- Unity
 - Versio 2021.3.11f1

6. Mitä harkka sisältää?

- Editortyö
- Koodi
- SFX
- Markkinointi
- Testaus
- Balance
- Optimointi

7. Kommunikaatio harkassa

- Discordin intern-text-aapo -kanavalle
 - yhteenveto jokaisesta yksittäisestä tehtävästä (perta / joku muu)
 - Aapo jakaa tänne progressiota tehtävään sopivalla tavalla, muut voivat kommentoida

- Työpäivän lopuksi Aapo laittaa pienen TLDR-viestin työpäivästä. Samalla voi laittaa kysymyksiä mitä tulee mieleen (laita "@nimi" jotta tulee ilmoitukset kysymyksistä)
- Miroon työtehtävien progressio lapuilla (värikoodaus)

8. TODO aluksi

- Tutustu projektiin
- Tutustu materiaaleihin
 - [Design doc](#)
 - [Steam-sivu](#) & updatet sieltä
 - Community [Discord](#)
- Sovi Joonaksen kanssa palaveri jossa käynte läpi SFXien tekemistä ja streamer contact -listan rakentamista
 - 7.1. Työn alle
- Mieti sopivaa tapaa dokumentoida työntekoa: docs, miro, joku muu? Miten presentoit tekemiäsi asioita?
 - Refeksi alin devlogit
- Tyypaile tapaa ilmoittaa aseiden speksit paremmin level upissa
